Japan	80
India	79
South Korea	69
Marshall Islands	56
Iran	55
Hong Kong, China	51

WHAT THE COMPOSITION SHOWS

- Product tankers account for 45% of all full transits — the trade most exposed to the current threat picture.
- Dry bulk (22%) and general cargo (14%) make up the next largest shares; container traffic is a small minority at 6%.
- Panama, Liberia and the Marshall Islands lead the registry picture; UAE, China and Greece lead beneficial ownership.

Percentages are of full transits since 28 Feb 26. Route attribution for the daily series reconciles to the reported 12/6 outbound and 15/6 inbound northern/southern split.

MARITIME FLOW ASSESSMENT

WEEK ENDING 07 AUG 26
REPORTING RANGE 28 FEB 26 – 06 AUG 26

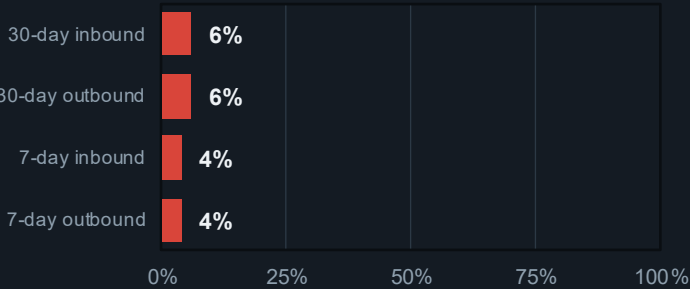

TRIDENT COMMENT

Despite a brief recovery in late June, traffic through the Strait of Hormuz remains heavily suppressed. AIS transit data indicates operators are increasingly favouring the Northern route in response to projectile attacks, continuing security concerns and heightened enforcement activity.

KEY JUDGEMENTS

- AIS-detected transits are running roughly 90% below pre-conflict baselines and have been falling since the 24–26 Jun peak.
- The southern Omani route is the highest-risk corridor, accounting for 14 of the 16 projectile strike incidents reported since 6 Jul.
- Operators are changing behaviour, not simply substituting routes — vessels have aborted planned transits outright and rerouted north after attacks, which points to deliberate risk avoidance.
- Tankers continue to dominate what movement remains, although volumes across all vessel types stay suppressed.
- Engine rooms were the primary damage location in 11 incidents, so strikes are bearing directly on vessel mobility and operational continuity.
- US enforcement action against Iranian-linked shipping continues in the Gulf of Oman and Arabian Gulf, adding a further layer of operational uncertainty.
- GNSS interference reporting sits below its Mar 26 peak, indicating physical threats currently present a greater concern than electronic disruption.
- JMIC threat assessment remains elevated: SEVERE for the Strait of Hormuz, SUBSTANTIAL across the Gulf of Oman, Gulf of Aden and Bab el-Mandeb.
- IMO traffic separation arrangements remain suspended, with no indication of an imminent return to normal routing procedures.

SHARE OF THE PRE-CONFLICT AVERAGE

JMIC THREAT ASSESSMENT

Strait of Hormuz	SEVERE
Gulf of Oman	SUBSTANTIAL
Gulf of Aden	SUBSTANTIAL
Bab el-Mandeb	SUBSTANTIAL

INCIDENT TREND — DYNAMIC, VOLATILE, ADAPTIVE

Mar 26 — Conflict onset. Iran closes the Strait and targets commercial shipping with drones and small boats; US strikes Iranian naval assets. Trend: missile, UAV and USV attacks alongside SoH disruption.

Apr 26 — A temporary ceasefire and reopening give way to renewed closure once diplomacy fails. Trend: coercive maritime activity — harassment, warning shots, VHF threats.

May 26 — US convoy operations and Iranian attacks on merchant shipping return the picture to kinetic. PGSA established to regulate and toll transits.

Jun 26 — Mixed diplomatic progress alongside continued enforcement. Trend: interdictions and attacks on vessels transiting the Strait despite easing blockade conditions.

Jul 26 — Ceasefire collapse drives large-scale US-Iran escalation. Trend: increased missile, drone, USV and small-boat threats to commercial shipping across the region.

Incident attack density uses 100 NM natural breaks. Some incident reporting remains single-source and cannot always be verified beyond the initial report.

- TRIDENT COMMENT
- The northernmost incident sits at 17°N, consistent with the northernmost attacks recorded over 2023–2024; across the same period, 056°E and 10°S marked the eastern and southernmost limits of incident activity.
 - Threat to shipping currently tracks the declared blockade on Saudi-linked tonnage.
 - Three events have been reported to UKMTO — fewer than the Houthi claims of 5 Aug 26.
 - JMIC threat level for the Southern Red Sea, Bab el-Mandeb and Gulf of Aden is SUBSTANTIAL.

Red Sea and Bab el-Mandeb events are recorded separately from BMP-defined piracy activity, with the focus on kinetic action targeting commercial shipping. A 22% decrease in Bab el-Mandeb transits was recorded prior to 22 Jul 26.

23/05/26	WITHELD	WITHELD	TANKER	13°35'N, 50°37'E	Small craft approach	060-26

Piracy density uses 250 NM natural breaks; the wider radius accounts for the mobility of pirate action groups (PAG).

TRIDENT COMMENT

- Piracy incidents meeting BMP criteria have shifted away from the Somali coastline and towards the Gulf of Aden.
- The record of past hijackings and boardings establishes a demonstrated reach of up to 400 NM offshore.
- Recent reporting also captures opportunistic attacks much closer inshore — evidence of adaptive, flexible tactics.
- Four vessels remained under pirate control as of 31 Jul 26.
- JMIC threat level is SUBSTANTIAL for the Gulf of Aden and MODERATE for the Somali Coast and Somali Basin.

Red Sea

Arabian Gulf

Gulf of Oman

GNSS INTERFERENCE REPORTS SUBMITTED TO THE VRA · 2026 YEAR TO DATE

Reporting peaked in Mar 26 and now sits below that level. The 604 reports received year to date include 61 in the last 30 days; all figures are voluntary submissions and should not be read as a complete representation of interference activity across the VRA.

TRIDENT COMMENT

- Interference reported during 2026 stays concentrated in the Red Sea, Gulf of Oman and Arabian Gulf, with the heaviest clusters in the southern Arabian Gulf and along the Red Sea transit corridor.
- Reports over the last 30 days continue to fall inside those same areas, so the geographic footprint of disruption has held broadly steady through the reporting period.
- The heaviest concentrations of interference reports align closely with where anomalous AIS positions and implausible speeds are observed — two independently derived datasets pointing at the same underlying disruption, which raises confidence in the assessed extent.
- Reporting is voluntary and single-source: not every vessel affected will report, and not every vessel in an affected area will experience interference.
- Masters and operators should continue to follow company procedures and relevant industry guidance, and report suspected interference to raise collective awareness of navigation risk.

LEXICON

DEFINITIONS, SOURCES & CONDITIONS OF USE

TRIDENT

WARNINGS

Trident warnings alert the maritime industry to attacks, boardings, hijackings and other maritime security incidents occurring inside the Voluntary Reporting Area, giving Masters and Company Security Officers timely notice to inform risk decisions.

ADVISORIES

Security-related reports received within, or relevant to, the VRA that fall short of the BMP threshold for issuing a warning. Published to sustain situational awareness and keep industry informed of regional developments.

IRAN-US CONFLICT RELATED INCIDENTS

Maritime security incidents reported to, or shared with, Trident that are potentially linked to the Iran-US conflict across the Arabian Gulf, Strait of Hormuz, Gulf of Oman and wider Arabian Sea.

RED SEA ATTACKS ON SHIPPING

Incidents in the Red Sea, Bab el-Mandeb and adjacent waters. Counted separately from BMP-defined piracy, with the focus on kinetic action against commercial shipping.

PIRACY RELATED INCIDENTS

Incidents inside the VRA meeting BMP piracy reporting criteria — hijackings, attacks, illegal boardings and suspicious activity — predominantly across the Somali Basin, Gulf of Aden and wider Indian Ocean.

TRANSIT OVERVIEW

Built from AIS data, enriched with vessel characteristic and ownership data from S&P, with tracks operator-verified to counter GNSS interference and AIS manipulation. A full transit is an IMO-numbered vessel completing a movement between the Arabian Gulf and the Gulf of Oman by any current route inside a 24-hour window; movements that do not complete in that window roll forward to the following day or are held as local/partial movements.

EVENT DEFINITIONS

Aligned to BMP Maritime Security (BMP MS) terminology and classification wherever possible.

HIJACK

Attackers take control of a ship against the crew's will, for purposes such as robbery, cargo theft or kidnapping.

KIDNAP

Unauthorised forcible removal of one or more people from a vessel.

ATTACK

Aggressive approach or hostile action against a vessel, including the discharge of weapons or missiles, or loitering munitions striking on or near the vessel.

ILLEGAL BOARDING

Boarding without lawful authority, intending theft, harm or another criminal act, but without taking control of the vessel.

ATTEMPTED BOARDING

A close approach with visible boarding paraphernalia or clear indicators of intent, where the boarding fails or is defeated by defensive measures.

SUSPICIOUS ACTIVITY

Unaccountable actions, behaviours or circumstances suggesting a potential threat: unusual equipment, abnormal crew numbers, high-speed approaches, multiple skiffs, out-of-place vessel types, or behaviour inconsistent with normal maritime operations.

NOT EXHAUSTIVE

Other incidents, vessels or behaviours may reasonably be assessed as suspicious on the professional judgement of a Master, crew, reporting authority or maritime security organisation, taking local operating conditions and community reporting into account.

GNSS REPORTING

Year-to-date interference reports submitted voluntarily by vessels operating in the VRA. Concentrations broadly coincide with observed anomalous AIS positions, raising confidence that both datasets reflect the same underlying disruption.

INFORMATION SOURCES

All information in this report is UNCLASSIFIED. Compiled from commercial AIS, geospatial analysis, vessel and industry reporting, open sources, and material shared by partner organisations — including UKMTO, the Joint Maritime Information Center (JMIC), Maritime Security Centre Indian Ocean (MSCIO), Information Fusion Centre – Indian Ocean Region (IFC-IOR), US Naval Cooperation and Guidance for Shipping (NCAGS) and the MICA Center.

ATTRIBUTION

Incident counts, positions and vessel details in this edition are drawn from UKMTO reporting for the period and are reproduced unaltered. UKMTO retains attribution for that source material; Trident is responsible for the analysis, presentation and judgements set out here.

VALIDATION

Where practicable, reporting is assessed multi-source and cross-referenced against available AIS, geospatial, industry and partner information to improve confidence and reduce duplication. Some vessel and partner reporting remains single-source and independently unverifiable.

USE

Issued to support maritime security awareness, voyage planning and risk-informed decision-making by Masters, operators and Company Security Officers. Read alongside company procedures, Flag State guidance, BMP MS and vessel-specific risk assessments. Nothing here constitutes navigational advice, routing recommendation, operational direction, legal attribution of responsibility or determination of liability.

CURRENCY

Figures reflect reporting available at the time of publication and may be amended as further information becomes available. Trident cannot guarantee the completeness, accuracy or continued validity of third-party reporting.

TRIDENT REMAINS A NEUTRAL AND IMPARTIAL INFORMATION PROVIDER, SUPPORTING VESSELS OF ALL FLAGS AND OWNERSHIP OPERATING WITHIN THE VRA.
